

Abstract of The Disclosure

A method for automatic asset registration. An electronic registration database is provided by an asset manufacturer or third party, such as a credit card company. An electronic data file comprising data specific to an entity that purchases or owns assets is provided. The data file can be loaded onto a purchasing or owner entity's computer or installed on a smart credit card. In one embodiment, the data file is loaded onto a third party's computer. The data specific to an entity is extracted from the electronic file and entered into the registration database. Data specific to an asset is also entered into the registration database and associated with the data specific to an entity; thereby registering the asset for the entity.
